TITLE: System and method for delivering financial services

Brief Summary Text (19):

The invention, in a preferred embodiment, is a system and method for delivering financial services to a remote device. Through the remote device, a customer or employee of a financial institution can select a mini-app dialog component to perform a function. Preferably, each function that may be performed is represented by a separate mini-app dialog component. Upon selection of a function, the mini-app dialog component collects information needed to perform the requested function and instantiates a transaction executor component to carry out the function. The remote device may comprise any type of device, such as a personal computer, screen phone, ATM, personal data assistant, or an internal staff terminal. The remote device may access the system in a variety of ways, such as through an external service provider, through the Internet, or through dial-up access. Thus, the system provides a single base for interfacing with all types of remote devices.
